How about a list of the manuals? I'd hate to spend a lot of loot on
shipping charges for a bunch of books that I already have.
Are they databooks? Which technology?
Application manuals? Which vendors? Approx year of publication?

Thanks for offering them to us before recycling.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

3. 6-meter 1kW amplifier modules

I have several 1kW television transmitter modules that will work fine on
6 meters.

A full write up and pictures are available here.
http://www.gemoto.com/LarcanPA.htm

These are the "low-split" modules that do not require any further
modification.

With some work, these amplifiers will produce well over 1kW on 2 meters.
Check this writeup by Brian Justin, WA1ZMS
http://members.rennlist.org/warren/larcan_2m.pdf

RF input and DC input connectors are included but other parts are needed
to get operational. DC power supply 50V @ 50A, RF coaxial relays,
cooling fans, etc. Some assembly required. :)

Price as per the web page above, $370 plus packing and shipping from
Nova Scotia, Canada. Total cost approx $455 - $470. Proceeds of the
sale go towards my ham club.

Contact info on my original ad on QRZ.

I assume Dave got the email I sent him yesterday with a partial list,
and that nobody else has any interest (either). That's quite
reasonable, considering the availability of old data sheets as PDFs on
the web these days...which is a large part of why I'm wanting to get
these books outta here.

Cheers,
Tom

Hi Tom,
Thanks for following up on the books. No, I didn't get your email with the
list of manuals. If you don't mind, please send it again. My correct email

is
dgminala at mediacombb dot net. Just substitute the appropriate characters
for the "at" and "dot" the address.

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

What is currently being made are audio tubes, plus perhaps 6146s, 807s, 811s, 572bs, and a few rectifier tubes. Guitar amplifiers are why there is still even such a thing as a new small tube business. 12AX7s,ATs, maybe AYs, EL84s,EL34s, 6L6s,6550s, KT88s, and a few mixafewofem spec beam power pentodes. There are also some power triodes including 2A3, 300B, etc but at ridiculous prices.

Better you should ask: What tubes can I get cheap in quantity? That I can get a lifetime supply of cheap? Answer: the tubes that DON"T go into guitar amps, hi-fi equipment, CB linears (sweep tubes) or the few specific rare types that are scarce for old radios people collect. Answer: everything else. Almost all series string heater types. Six and twelve volt heater tubes for TVs. Design around those rather than the types you have to bid against guitar and hi-fi people, who often have too much money.

I would use seven and nine pin miniatures out of the later RCA tube manuals as much as possible after checking to see that the price is cheap, from a tube vendor price list. When you rule out popular audio types and sweep tubes and the rare birds like 6E5 seeing eyes, the rest are cheap. Audio sharks often buy whole tube caddys and throw the series string tubes in the dumpster.

VHF push-pull transmitter, like the rest of the QQ series. Double tetrode
with a common cathode and common g2. Interesting pinout isn't it?

I have some QQV03-10 valves that I intend to try for audio. They are
supposed to be quite good.

I was hoping someone might know some specific applications, e.g.,
equipment that used it.

industrial and military.

You might even have found one inside a satellite.

Are there any old tube type CB radios around?

I suppose size might matter, but sometimes old tube type
power transformers can come up with a "close enough"
impedance ratio.

Another old time solution was to find a tube type speaker
output transformer, with the secondary on an outside winding
which could be stripped away, making room to add a new
secondary. (keep a log of turns removed on the old
secondary, so a good estimate of new turns required)
(to get impedances fairly close.. precision not required)

I barely see solid state CB sets around, so I suspect the
tube ones have long disappeared.

Besides, he's not in North America, and CB was mostly a North American
thing.

Or find a 400Hz transformer, nobody wanted them so at one time they were
not only available but cheap. Various articles said they worked fine,
since voice didn't have to go down to 60Hz.

One technique was to use only the primary of a center tapped (push pull)
audio output transformer. The modulator tube, running class A, was on
one side, and the other side was used as the supply for the RF output
stage, with the B+ to the center tap.

Why not build some superhets instead? They work better.

Regens have crappy audio, making them undesireable for SWLing or
listening to the few hams worth listening to who are on AM...

Because they are simple, and it's good to get something to work early on.

But I certainly had meant to ask why should anyone buy his book. Charles Kitchin over the past 20 years or so has done quite a bit with regen and superregen receivers. He had long articles on both in Communications Quarterly, looking back to the beginning (when most people have adapted more recent work, so it's like a broken telephone). By going back to the beginning, he was able to introduce some new concepts in superregen, which would never come up based on most of the descriptions of the receiver.

Circa 1915, whenever Armstrong cameup with the regen, those things were pretty simple, for the simple reason that tubes were expensive, and bulky. In the transistor age, you can buy quite a few transistors for the price of a tube in the old days. Make the regen solid, like a VFO (which it really is). Add a buffer ahead of it, so the antenna doesn't affect operation as much. Use a separate detector, something so lost in it all that we talk about "regenerative detector" but the actual detection is secondary to the regeneration. Add a voltage regulator, nobody would do that in the old days, now it's hardly worth not doing.

That's some of the work Charles Kitchin has done with regens in recent years, some very basic receivers for the beginner (including one that used a crystal as the frequency determining element), some more complicated than others.

Or go take his work and go back to the thirties, and build a supergainer out of Frank C. Jones' Radio Handbook. A compromise/hybrid, it's a regen with a converter ahead of it, or looked at another way, a superheterodyne with a regen detector. Takes out some of the issues of the regen, it isolates the detector from the antenna, the regen stage doesn't have to cover a wide range (and if the converter is tuneable, the regen stage

stays on one frequency). You can even put a crystal filter between the mixer and the regen stage.

So a regen still has potential. A simple receiver to accomplish building something (41 years ago, I rushed down to the parts store with a list of parts out of a magazine, and that project, and the one after, never worked, in retrospect I can see lots of reasons why. But I kept at it, and then I did get some things going, ironically out of scrap parts, having learned enough to actually know what I was doing). But it can also be a method of experimentation. Not to create Something Important, but by trying new things, one can learn.

with a regen detector. Takes out some of the issues of the regen, it isolates the detector from the antenna, the regen stage doesn't have to cover a wide range (and if the converter is tuneable, the regen stage stays on one frequency). You can even put a crystal filter between the mixer and the regen stage.

So a regen still has potential. A simple receiver to accomplish building something (41 years ago, I rushed down to the parts store with a list of parts out of a magazine, and that project, and the one after, never worked, in retrospect I can see lots of reasons why. But I kept at it, and then I did get some things going, ironically out of scrap parts, having learned enough to actually know what I was doing). But it can also be a method of experimentation. Not to create Something Important, but by trying new things, one can learn.

Ah, yes, the one tube (01A) regen on the broadcast band, late at night North of Seattle Washington, listening to Snake Oil Salesmen from Del Rio, Texas, With transmitters in Warez, Mexico.....XERF, ISTR. A thrill that must be experienced to be believed. And the Grand Old Oprey or the Barn Dance!! KGO and KSL came in like gangbusters!!

I tried it (many years ago, when I was a boy...) but it doesn't work well: most push-pull output transformers are designed for a null total cc flux (currents in the two halves of primary winding should be equal and opposite) and, when driven in single-ended, the core saturates and severe degradation of audio response occurs.

Hi OM Giovanni,

You could use an audio amplifier tube as the modulator with its matching
audio output transformer for choke modulation.

Here's how I did it.

The guys presented a lot of great ideas.. If a conventional plate
modulation
transformer is found, and 100% modulation of the final RF stages plate
voltage is achieved, the next logical step (I think) is to introduce
"Negative
Peak Clipping". A highly controversial method that clipped a little of the
negative modulation envelope, and added that same amplitude to the
positive envelope peaks.
100% PLUS modulation! Oh, how the purists did cry! Fact is, that
oscilloscope observations were convincing, over the air observations
while switching the "clipper" in and out were totally convincing. It
worked! There was a little commercial AM broadcast testing, with
FCC strictly against such abhorrent practices, but it did work. I swear.
On the receiving end, the audio sounded much like the current
practice of Television stations "enhancing" commercial advertising.
The received audio amplitude would increase startlingly.
Detractors "proved" mathematically that this distortion of the AM
envelope introduced undesirable sidebands, but hey, with my
10 watts input to a 2E26 final, nobody ever complained.
Time frame, AM glory days 1955 to 1958.

Use a filament transformer. Primary winding to the plate circuit,
secondary winding driven by the output of a PA amplifier.

You could do all that or you could just add a LO and mixer and then
the radio only has to work at one frequency.
Simple.

Another good area to start off with is crystal sets, from an era when they had to be sensitive and serious receivers as they were all there was.

For SSB, CW and improved AM reception you add a 1 transistor VFO/BFO, which amongst other things brings up the sensitivity.

There's a video demo of this here:
http://www.youtube.com/watch?v=ihLbcaOvhiA

I would use this as your baseline for comparison with regenerative and direct conversion. The 'amplified crystal set' approach doesn't have the frequency pulling problems that regen sets can have.

Does anyone here have any spare terminal covers for a Bunnel Flameproof
morse key? How about any good ideas for creating one from scratch?

I suppose the original ones burned?

No, I bought it that way. I'm thinking it would be fairly simple to get
a piece of hard plastic square rod and drill-press out a cavity. But I
don't have a drill press and I'm hoping maybe someone might be convinced
to make one.

I was aware of that and waited too long to grab one, so I got one from
Ebay, which didn't have the cover. I'll see if JH Bunnel has any covers
left over.

59. adjustable noise blanker modification?

Newsgroup: rec.radio.amateur.homebrew

From: Bill Peters <peterswilliam2591@excite.net>
Message-ID: <jgjmvf$n9t$1@dont-email.me>

I recently converted a couple of CB's to different bands: one to 10 meters and the other to 12. Although both have effective noise blankers (they are Cobra/ Uniden CB's), I'm wondering if it's possible to make the blankers adjustable in any way? When aligning them, two Toko (or similar) inductors on the board have to be adjusted for minimal noise but of course I wouldn't be able to adjust these on the road since they are internal. Thoughts or ideas?

Thanks,
Bill

Hi,
I have put together a short book on regenerative radio receivers to
mark the 100'th year of the discovery.
It is available here:
http://www.webstore.com/Regenerative-Radio-Receiver-Book,name,14754474,auction_id,auction_details
It explains all the main topics needed to make a regenerative receiver
work right first time.

Unfortunately Mr Kitchin does not seem to understand the basic theory
of how regenerative radio receivers work. People who have built his
circuits often have irresolvable problems trying to get them to work.
In my book I indicate exactly what the problems are and how they are
solved. There are also a bunch of circuits that are of general
interest to anyone building any type of radio. All in all for the
price you get a lot more than you would get in a copy of QST for
example.
The book is now here:

Are you sure that inductors you talking about are in audio circuit
are they are in RF gain circuit some CBs come built in noise limiter?

Listened to many a ball game on a little one tube ginny I built from plans in a book I found in the school library. . Later added a pre-amp and two tube audio amp. Last thing I added to it was a preselector using two ferrite loop sticks and a 2 section variable cap. All the different sections were on their own chassis. It evolved to its final stage over 8 years. When I was in college my friends thought I was nuts for listening to a junky radio like that.

hey guys,

if you are interested in non icom hardware working very well - look
here : www.dvrptr.de
and soon C4FM / 4FSK 4800baud (APCO P.25 Phase I)

For order info just press the link http://flyheli.dyndns.org/dv/dvorder/Default.aspx

Find here the news posted in the yahoo group :

Starting in April 2012 we will have two additional boards which can be
plugged
on the DV-RPTR board:

1) AMBE Speech Codec Board

This tiny board has connectors for Microphone and Speaker. Together
with the
DV-RPTR and an FM transceiver you get a real DV transceiver.
This board has two modes:
* DV Transceiver to make QSOs via DV Repeaters or direct
* DV Dongle Mode to talk via Reflectors in the internet

2) FM Transceiver Board
---
a little add-on board to be plugged on the DV-RPTR. It has a simplex
transceiver
based on the well known chipset which is also used in the UV-3R. It
covers 2m
and 70cm HAM bands. The output power is 2 watts max.
It turns your DV-RPTR into a wireless hotspot.

Both boards can be connected to the DV-RPTR at the same time. Then you
have a
real DV-Transceiver. In this configuration it does not fit into the
little metal
box, you will need another box.

Please help us !
We need to know how many AMBE Chips and Transceiver Chip we have to
buy. If you
are interested then please go to www.dvrptr.de and register the
quantity of
boards you need.
Thank you

A solution to that is to make it more like they used to do AM
broadcast transmitters: feed the RF stage its DC through an audio
choke, and capacitor-couple the audio into the RF deck end of the
choke (from one of the plate connections on the audio transformer).
If the audio amplifier and the RF deck use the same plate voltage, the
capacitor doesn't need to handle the full DC voltage, but it should be
non-polar. The problem then becomes one of finding (or winding) an
audio choke with enough inductance and that can handle the current.
In AM broadcast transmitters, the modulation choke was typically the
largest component. Since for voice you should only need to get down
to 300Hz or so, 10 henries inductance should be OK (about 20k ohms
impedance), and you might be OK with less. A 4.7uF coupling capacitor
should work OK, as it would be just over 100 ohms reactance at 300Hz.
4.7uF film capacitors aren't unreasonable to find. You wouldn't ever
get to 100% modulation, since the audio side doesn't go to zero volts
on the plate of the conducting side, but you could add the voice coil
winding in the proper phase to get a bit more modulating voltage.

I've also seen a design where the modulator was single-ended but used
a push-pull transformer; the RF amp was fed its DC through the other
side of the center tapped winding. That allowed reasonable balance of
the DC in the transformer, and worked decently.

Cheers,
Tom

Thanks for sharing that, Ian. The webpage says "1960's." You wouldn't happen to know any closer than that, would you? The one I'm thinking of was a homebrew unit that as far as I know was developed by Dick "Mitch" Mitchell in Washington state. I forget his call. He developed it before I became a ham, so it must have been mid 1950's. He used a 6146 RF PA, and 6146 modulator output. It was a minimalist design, using a carbon mic with a mic transformer to directly drive the modulator grid. I think he had a couple tubes in the RF chain before the 6146, but I don't remember. It was very compact, built entirely inside a 3" high aluminum chassis box, probably 10" x 12". It used an external power supply: a dynamotor in mobile applications, typically. We typically used one on Field Day, and given how much power was dissipated inside that small box, I was a little surprised that we pretty much never had any problem with it. I don't recall now if he built them as single-band units, or had some band switching.

Cheers,
Tom

No really. It was just that the mention of the centre-tapped modulation
choke immediately reminded me of the Codar AT5 and the matching
receiver, the matching receiver, the T28. I used the pair mobile back in
the 1960s, and although such equipment is hardly up to today's
more-exacting standards, I had great fun with them. You occasionally see
the odd one (or pair) on sale at the various amateur radio rallies, for
around $50.

this is of course a perfectly good solution, at least from a technical point of view, but... audio chokes are nowadays precious rare modern art masterpieces :) and the only practical way to get a suitable one is to wind it yourself, which is more or less the same as winding your own transformer :)

been there, done that - it sure works, in a fashion... but not very satisfactorily. At the time when I tried it, I reasoned that using a single ended audio tube with a plate current more or less similar to that of the RF amp tube, the total core flux in the transformer should be more or less balanced - what I did not know then (I was *very* young...) was that average plate currents mean very little, saturation occurs because of peaks! :)

==========
To my knowledge it is called Heising modulation.As a young
(radio-unlicenced) boy I made a single 6K7 valve(tube) oscillator for
the 80m band with the anode fed by the anode voltage of a single EL3
output valve 4 Watts audio amplifier meant to feed a loudspeaker. With
a long wire antenna the results were an amazingly clean AM signal
getting out well in excess of 100 km
Those were the days before SSB.

Frank GM0CSZ / KN6WH only licenced since 1985.

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

86. How to measure high tube amplifier voltage

Most multi-meters only measure voltages up to 1000 volts. How do you measure voltages often used with tubes like 3-500z or 3cx1500a7 tubes? Will the range extended from Fluke listed below work with a 1000v 10 mega ohm multimeter?

80K-6 High Voltage Probe
http://www.fluke.com/fluke/usen/accessories/high-voltage-probes/80k-6.htm?PID=55358

The multimeter I have is the Radio Shack 22-801 which is rated for up to 1000 volts.

Yes, the probe will work with your multimeter. The probe description says
that it will work with any multimeter that has a 10 Megohm input impedance.
Your multimeter manual says that it has a 10 Megohm input impedance on DC
and AC functions.

I have a couple SN75161AN GPIB (HP-IB) bus transceivers that I'll post
to the first person who wants/claims them, to save them from the
trash... These are unused HP surplus parts, in conductive foam.

(I'm also liable to soon have a bunch more DIP-packaged logic
available. Anyone out there still use this stuff? It's still fine
for playing with, but I just don't see myself doing anything with it.)

Cheers,
Tom

Go to the BAMA mirror site at
http://bama.edebris.com/manuals/military/ts118/ and download the DJVU manual
for the TS118A. It has the charts that you're looking for.

I am very new in electronic circuits and I am using NE612 as a frequency mixer. In the datasheet a sample circuit for this purpose is shown. Nevertheless, it is for 45 MHz. There are some capacitors and inducers shown in the circuit diagram. However, I need to use some other frequencies as well. I was wondering if the values of capacitance and inductance which are shown in the datasheet should be changed for frequencies other than 45 MHz. I am not using it in radio applications, so I only need to have the IF produced in the output. I am really looking forward to hearing some help. If I have to change them, how should I measure them?
Thanks a lot for all helps

I suggest you refer to the application notes for the device. This will probably be your best source of information.

DO THIS WITH EXTREME CAUTION. Knowing the input resistance of the meter it is easy to use a series resistance to scale the input voltage. I have inserted 11M
in the front end of my 11M input impedance meter to make a 2X voltage divider. I connected the meter to the circuit, placed it in a Pyrex baking dish for insulation, stood at a distance and energize the power supply. I used several HV resistors removed from an old TV because I figured there was a danger of arc over using common resistors. I was truly surprise the meter didnt melt down annd the house main breaker didnt trip.

Bridge the pad with a DPST switch or relay. Switch "on" pad "off".

I have several 1kW Larcan television transmitter modules available.
These are "low-split" modules and do not require modification for
6-meters. They will also cover the 70MHz / 4-meter band with no changes.

A full write up and pictures are available at
http://www.gemoto.com/LarcanPA.htm
(Note: This is NOT my web page and is supplied for information purposes
only)

With some work, these amplifiers will produce well over 1kW on 2 meters.

RF input and DC input connectors are included. Other parts such as DC
power supply 50V @ 50A, RF coaxial relays, cooling fans, etc are needed
to get operational. Some assembly required.

Packaged weight is about 20kg / 44 pounds. The amplifier module itself
weighs about 14kg / 31 pounds.

Price is $370 plus packing and shipping from Nova Scotia, Canada. Total
cost approx $455 - $485 throughout the USA. Proceeds of the sale go
towards my local club. PayPal preferred.

Further information, pictures, etc available on my web page.

I actually built a HV meter for an amplifier project years ago using a surplus 0-1ma panel meter and a string of 10 meg ohm resistors. The resistors were 1/2 W 5% and the entire string was covered with two layers of heat shrink tubing for insulation (heated to shrink it around the resistor string). I hand selected the resistors measuring their value with my Fluke mutimeter so I actually had an accuracy better than 5% in the multiplier chain. The panel meter I used was intended to be inserted into a HV circuit so the case was insulated to withstand the voltage with the meter panel mounted. While I connected the meter across the full plate supply voltage, if you are using series connected capacitors in your plate supply (with divider resistors across each cap) you can connect your voltmeter 'tapped down' on the divider chain and multiply the reading by the divider ratio. This will be safer than measuring the full voltage directly, but you will lose some accuracy depending on the tolerance of the divider/bleeder resistors across the capacitors. In most cases you don't need to know the plate voltage to better than 5% anyway.

==========
Perhaps it is useful to mention that non-HV resistors should not be
ï¿½exposedï¿½ to more than 500 V , meaning that for a measuring range of for
example 5000 V any string should have not less than 10 resistors

(whatever the resistance values required)
Personally I would tap a relatively low voltage from a loop string with on the tap a ten-turn trimpot in series with a fixed resistor.
If the DVM would have a max range of 1000 V I would first by means of a variac adjust the PSUï¿½s output to 1000 V ,directly measured with the DVM . Thereafter with the string in place I would connect the DVM to the tap and adjust the ten-turn trimpot for the correct multiplication factor with the DVM range set at a range lower than 1000V . The ten-turn trimpot would be exposed to a low voltage differential and serve only for fine adjustment. All this would result in a measuring uncertainty of better than 5%.(assuming the DVM has a measuring uncertainty equal or better than 2%)

I am conducting ongoing experiments with regenerative radio receivers. One problem I have repeatedly encountered is low frequency squigging/motorboating. Particularly when using somewhat higher CE transistor currents. Oddly, changing the values of any of the capacitors in the circuit did not change the frequency of the squigging. There was nothing wrong with the decoupling and even adding additional decoupling capacitors had no effect. Almost certainly the unwanted low frequency oscillations are due to electrothermal effects.
Directing hot air from a hairdryer at the transistors for less that a second stopped the low frequency oscillation. After stopping the hairdryer the circuit started squigging again after a couple of seconds.
The fact that regenerative receivers are operated with the amount of positive feedback (regeneration) so close to the threshold of oscillation makes the extremely sensitive to the gain of the sustaining amplifier.
Even slight changes in the gain of the transistors (caused by self-heating or the environment) can then have a big effect. This is almost certainly the basis of the low frequency squigging in the circuit.

Errrrp. That leaves the pad in-circuit across the line...not good in most situations. Better if the switch also disconnects the pad from the line. You probably need a 4PDT switch: the four moveable contacts to the input and output lines, the four fixed contacts on one side to the four terminals of the pad, and the four fixed contacts on the other side wired so the line connects straight through. You can do it a bit more simply by bridging the pad with the DPST as suggested, but also adding a SPST that is N.O. if the DPST is N.C., with the SPST opening up the shunt path in the H-attenuator.

If you leave the H-pad in the circuit, bridging it with a DPST and not opening up the shunt path, assuming the pad is the same impedance as the line (=R in the following...), you shunt the line with 8.7*R for a 1dB pad (not terrible...), 2.9*R for a 3dB pad (not so good), and 0.95*R for a 10dB pad (pretty awful).

Cheers,
Tom

This is probably what you're looking for:
http://www.arrl.org/files/file/Technology/tis/info/pdf/9506033.pdf
With careful construction, you should get pretty accurate results at HF and
VHF frequencies. Using SMD resistors in the construction should yield even
better performance than described in the construction article, since it
looks like the author used metal or carbon film resistors, which are
somewhat inductive. Use of a PCB and good shielding between the sections
should give you a really good attenuator.
Granted, the article describes a Pi-type attenuator, but the technique
should be applicable to an H-type circuit as well..

But that's "normal".

Howard Armstrong noticed it early on, and never pursued it. Then later, I think when he was doing some work on regeneration preparatory to the court battle over the patent, he noticed it again. And then he pursued it, and got superregeneration. So his original regen circuit could oscillate at ultrasonic frequencies as well as at radio frequencies if the regen was turned up too much. It was just incidental, later he tried an external ultrasonic oscillator to "modulate" the regen receiver, but for most of the time ever since, the same active device has been both the RF transistor and the ultrasonic oscillator. It was all very black box for most of that time, as it got relegated to secondary status, the explanations dropping off and few pursuing it much.

It's really a scheme similar to reflex (where one stage is both amplifying radio frequency and audio frequency) or "autodyne" circuits, where the same stage is both a rf mixer and rf oscillator.

One project in QST and later their VHF manual had a receiver chain that used converters feeding an IF strip and then a regen detector, the regen detector configured so it could go into ultrasonic oscillation too so it

could be either regen (for CW) or superregen.

Turn down regen. That may fix the problem. Or try another circuit.
Realistically, it's not the sort of thing that people report, so it would
seem plenty of regen circuits, tube and transistor, don't have a problem.

Tom,That was what I came up with too. At first I thought it looked overly complicated. I was hoping there would be a simpler way that I was missing.

Close Dave, I need to modify this for H type balanced pads so I am thinking 4PDT switches.

117. trying to halve power to RF ammeter

I'm trying to get some accurate power readings with a low power rig (<5 W) and an RF Ammeter. The trouble is that the ammeter doesn't read quite up to the highest level of the transmitter and I need to reduce the power to the meter by about half. I'm thinking a 3 dB attenuator, but how am I going to find the oddball resistances and what about resistor wattage? Is there any other way to reduce power to the meter? Need something simple, quick-- but accurate. Thanks.

Use the calculator at
http://chemandy.com/calculators/matching-pi-attenuator-calculator.htm to
find resistor values. This calculator lets you adjust the resistor values
to values that you have, or can easily construct, and the recalculates the
attenuation with your new values.
Don't forget that you can use parallel/series combinations to get pretty
close to the ideal values. Mouser and Digikey stock a pretty wide variety
of resistor types and values. Be sure to check them out.

You'll need to know the impedances of your transmitter output and the
antenna in order to get correct R values.

Cheers,

I'm not sure there are any simple answers to obtaining "accurate" power
readings
with an "inline" RF Ammeter. (due to variable input and output impedances
and response
of MOST RF Ammeters, and such). However it is relatively easy to increase
the
range of an RF Ammeter by shunting it (paralleling it) with a low
resistance, low
impedance resistor made from a short length of wire. (bailing wire, iron,
fence or
what have you)
The Ammeter will have a very low resistance to begin with, so a very
low resistance
homemade shunt wire resistor can be fairly short, and length determined by
quick
experimentation. Run RF through the meter and take a reading at almost (or
at) the
top end of the scale. Then temporarily jumper the meter with the homemade
shunt
and adjust it's length until the meter reads half scale (if you want to
double the meter's
range), and tighten things up. Done. At less than 5 watts you can do this
hot, with your
fingers. (assuming your final is not a tube type with plate voltage
appearing at the
antenna terminal... YIKES!!!!!
Results will definitely not be accurate, but should be repeatable for
most comparative purposes.

That's my story, and I'm sticking to it.

This is exactly how I would do it (in fact, I'm sure I did this about 50 years ago). As you say, a thermocouple RF ammeter will have a very low resistance between the terminals - and there's no reason why you can't measure it with a (probably digital) multimeter. You will then have a good idea of the value of shunt you will need. You can then do the final adjust-on-test 'make it read half' procedure.

121. 2.5KVA transformer on square wave 1000hz mains

I just bought a 50/60 hz transformer rated 575VAC
pri to 230VAC sec
rated at 2.5KVA on ebay. I remember reading some time ago that
transformer companies rated their transformers to 1000 hz.

I'm needing like a 3KVDC at about 1.5KVA semi regulated supply but
don't like to use lots of mfd's of filtering at higher voltages to get
there. For a 4X1 PA ima building.

So I figure getting there by using a tl494 and bridge switching 4
IGBT's at 1000hz
square wave on a 130VDC supply to the 230VAC winding on the
transformer. AT square wave I figure 325 VAC output, from the 575VAC
side.

Running a 10 step ladder multiplier, that would be 5 steps negative
and 5 step positive I should get around 3250VDC. On a half wave
multiplier I figure the last step being hit by 200 hz pulses at each
end of the ladder.

So Am I just spinning my Wheels? and stick with 60hz and lots of mfd's
with a autoformer configuration getting more VDC per step and going
with 6 steps, 3 up and 3 down at 60hz? And no easy way of regulation?

Raypasi,

Running the transformer at 1KHz will likely cook the core. The laminations will be much too thick at that frequency to keep the eddy current heating to an acceptable level. Generally the higher the frequency the thinner the laminations have to be. At some point the core material is changed to something else, like ferrite, to keep the heating down.

Hey OM:

I've seen 400 Hz transformers from old air force airplanes it's true
the lamination's are thinner but the physical size per unit power is
1/6 that of a 60 hz transformer. To wit a 2.5 k VA transformer made
for 400 Hz would weigh in at about 6 pounds compared to my Hammond
Canadian made performer at 40 pounds.

Looks like I'm going to be switching 230 v Dc from 2 separate 115 vac
lines on the same side of the main 230 vac line. I'll keep the switch
speed down to 120 Hz Since I found a stacked doubler that gives a
quadruple output. Thus the output capacitor charges twice as fast over
a ladder style multiplier.

Though one fellow ham told me to just buy a 1.5 k VA isolation
transformer to convert 115 to 230 vac. He is a Canadian ham also since
I have a Canadian Transformer.

Thanks for the advise

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

Nandu, why not just leave the new instrument and the commercial RF
ammeter connected in series, and then adjust the power level (by detuning)
of the power source (transmitter) and make a calibration table by comparing
known current to that which you are reading on dial of new instrument?

Some of us "old school" would make a new instrument dial by
disassembling the instrument, and reversing the dial plate (flipping it
over).
or creating a new paper dial plate with a computer, and glueing it over the
old one.

Good luck,
Lynn, W7LTQ since December 1948

Hi Old Chief Lynn,

Many thanks for your suggestions. Yes, I should do it one of these days.
The existing dial is well suited for marking with a fine 'permanent
marker' pen.

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

Built a Heathkit tube tester in 1975; and had reason to use it the other day.

Just wondering if there is any source for updated tube data since then?

How many new tubes were released after 1975? Power tubes yes, but they likely didn't fit the tester anyway. It was past the time of Nuvistors and Compactrons, and the 12V tubes for use in cars. Yes, people still used tubes in 1975, but they were fading (there were already articles about solid state replacements for tubes by 1975) and not much was being made with tubes.

Funny this topic just popped up. I mentioned to one of our younger techs at work (30 years old) that I was thinking of building a tube radio receiver from scratch just a couple days ago. Maybe for the FM broadcast band or maybe some amateur band and set it on the shelf over my bench at work. :)

I have a 1975 version of the "RCA Receiving Tube Manual"; anything not listed on the Heathkit list can probably be figured out from this.

BTW: there's a circuit included in the back for a FM tuner utilizing 3 tubes (two 6CW4 nuvistors and a 6KE8).

Have fun!

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived

Good luck! I had a 745 until the late 90s. I loved that radio. Wore the heck out of it but it reached the point to where it was like an old car. Always needed some tinkering.

I live in the Caribbean so the environment was a big factor. Cleaning cards and sockets and plugs became routine every time I wanted to use it. No major failures (it got new finals and a new ROM board in the early 90s).

Wish I could get another new one like it these days!

I was surprised to get $180 as-is out of it on ebay with a pockmarked front panel.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

IVe never used stepper motors before and would like to use a couple to control a simple L antenna tuner with just one roller inductor and one vacuum variable capacitor. My plan is to use a track ball I salvaged from an old arcade game as the human interface. The outputs of the trackball assembly are TTL level pulses when the ball is moved and a signal that is either high or low depending on which direction the ball is moved. There are two sets of these signals one each for X and Y axis. I was hoping someone could recommend a controller motor combination preferably a controller that will interface directly with the TTL voltage.

No it doesn't matter. But it sounds like you just have a bare piezo element, not the whole buzzer. What is driving it?

Huh?

If it's just the element, it probably doesn't matter. But if it's an
actual buzzer, of course polarity matters, since there's an active device
in there to make the sound, and it is polarity sensitive.

I suppose you are referring to the piezo element alone. In that case the
answer is 'no polarity' as the element responds to an ac signal only.

I have a nice auto multimeter. The continuity buzzer's out so I wanted to test it, replace with a radio shack element.

The meter turned itsself on inside the snapbox. Apparemtly the contacs touched killing the buzzer or driver.

When I tried it last, the buzzer buzzed twice then died.

Positive inside contact circle or outside ring ? Probably a standard

OK, this is not the answer, but a little tale about piezo buzzers.

I got a new "stud finder" (for locating wall studs in a building). It
was superb! Got the job done. Three or
four years later, I had occasion to use it again. Worked fine, except the
"buzzer" didn't sound. Tore it down
and found the little devil piezo element. Located a similar Radio Shack
element, and replaced the original.
Still didn't work. SWMBO said "hope you get tired of playing with that noisy
thing"....... HUH?
Well, piezo worked just fine. Ears had aged embarrassingly.

I lost a Wal Multimeter, giving a negative rating, when packing for a Xrosscountry trip. The meter was packed deep. It began screaming on Texas 1016 (?). bing bong bing....and down there it died.

The silent one now is an Acton from Summit Racing. It needs revival. I hope the buzzers dead so the prebuzz circuit remains alive.

But you should never keep a meter on ohms or continuity. Because those
are vulnerable ranges. You turn it on and measure some voltage, and bang
you blew a fuse if you were lucky, you've damaged the meter if you weren't
lucky. Keep it on a voltage range, which can handle anything that would
come across the leads. Put it on a higher voltage range if you really
worry, though the meter should be protected for overvoltage.

172. Numerical Optimizer (solver) for LTSpice IV

I have written a numerical optimizer (solver) for LTSpice. It automatically adjusts component values to meet circuit performance targets you set. For example maximum power output and minimum supply current. It uses a fast evolutionary algorithm to get good results quickly. You can get good results in anything from 5 minutes to a few hours depending on the complexity of the circuit. It is much faster and better than using any of the genetic algorithms available or the Simplex method.
Anyway I have provided a free trial usable until 5 August with a 3000 iteration limit. I am thinking about providing a 3 month trial with an iteration limit of about 500 afterwards.
You can try it here:
http://www.evospice.site88.net/evospice/evospice.html
I think it is a good add-on to LTSpice for homebrewers. It can help you design filter circuits, rf circuits and many other things. It would be a bit complicated for beginners because it uses things like .measure in LTSpice. For the more advanced homebrewer it could be ideal. If your ham-radio club would like a special evaluation version they can send me an e-mail at the address given on the web-site.
Best Regards,
Sean O'Connor

I have found that a relay controlled by the microphone PTT can be useful for solving the problem. Let a set of contacts from the relay key the radio and another control the transverter.

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

Come on, you've just replied to a message that is 18 years old. Nobody
reading the newsgroup back then is reading it now.

if you have a question, ask it. Don't reply to an old message, google
should be fixing that bug, and don't ask some nonsensical question that
doesn't seem to have any relationship to the original post.

I had my hearing checked recently, and the (not-unexpected) results
were "age-onset hearing loss" of about 10dB per octave.
(It actually onset'ted 10-20 years ago!-)

I'm pretty sure that, within the last year, there was a QST article
about a do-it-yourself hearing aid (I don't think it was called a
"hearing aid", but that's what it was, with selectable 6dB/octave
and 12dB/octave gain) for geezers like me, and I thought I had
saved/clipped that article, but I can't find it.

I tried looking at the table of contents of the digital QST, but
the download speed is so slooooooow that it's not worth the wait.

If you are a current QST subscriber and remember the article and could
tell me where to find it, or if you could even scan it, I'd sure
appreciate it.

That's not completely true. They aren't going to lock to an RC
oscillator, the reference oscillator has to be crystal controlled.

QRP still uses crystals, it's simpler and takes up less space and dowsn't
draw much current.

Anyone using an old analog receiver still has as much use for a crystal
calibrator as in the old days. That TMC GPR-90 I got at a garage sale in
August for 20.00 came with a crystal calibrator.

There can be various standalone items where simplicity or small size is
more important than changing frequency. So some sort of signal generator,
if you don't need variable frequency, a crystal oscillator makes it
simple. A lot of digital circuitry is clocked at a high frequency, there
again one uses a crystal, though sometimes in the form of a crystal
oscillator module.

If one wants a spare receiver for the local repeater, one might as well
resurrect an old crystal controlled receiver, be it a consumer "plublic
service band" receiver or a commercial two-way receiver, and so long as
you can live with one or a frew frequencies, crystals still make it
simple.

We beacon operators still use crystals. Even the PLL synthesizers need
a reference frequency and that is most often a crystal oscillator.

208. Modifying an SWR meter

I have an old Magnadyne SWR-72 for 11 meter (CB). I want to modify it
so I can use it on 2 meter (VHF).

The only frequency sensitive components I can see are a couple .001 caps
in parallel with a couple 150 ohm resistors. Can i change the meter's
frequency response by changing the RC combination in the circuit?

I would submit a photo but I don't know how to attach to this message.
Thanks in advance.

That appears to be the same as several types of SWR meters with a differant name. Most of them were rated to go to 150 mhz. Some were in about the same box with two meters on the box and no forward/reverse switch. I have used one up to 220 mhz and it seemed ok for adjusting for minimum SWR. They will not work at all at 440 mhz for swr.

The resistor is to match the internal line to the impedance. The .001 cap is just an RF bypass. The main things that determin the frequency are the two wires that are parallel to the wire going from the centers of the two pl259 connectors. If too short, they will not pick up enough signal to set the meter to full scale. If too long, they will not respond to the direction of the forward to reverse power.

If the meter is built like that, it will probably work from 0 meters to two meters just as it is.

Ralph, Thanks for your informative reply. You're right, there were
several manufacturers that made these units (Midland, Pace, Numark,
etc.). I did try to hook it up, but the SWR was 1.3:1 (almost the same
as I got with a dummy load), which I thought was too good to be true,

but maybe it was due to the low wattage being used (<4 watts). I'll get some proper cables built and go from there. Thanks again.

If you can get two 50 ohm dummy loads you can put them into a T connector
and the swr should be around 2:1. That is one way to run a quick check.

Some times using low power will cause the swr to show differant as the
diodes will not have enough voltage to act the same as they do with a higher
voltage. That is called the square law reagon. While the readings may not
be accurate, the lower the reverse reading, the better.

I should qualify that statement about the SWR. The actual SWR will be the
same nomater what power you use, but some meters will show a differant
ammount due to the way the diodes act.

Depending on the antenna and the ammount of coax, the swr can be shown as
very low. If you have around 100 feet of rg58, the swr the meter shows will
be very low and not too much you do at the antenna will change it.
I made that mistake about 40 years ago when I built a 2 meter antenna and
fed it with 100 feet of rg-8. The swr was about 3:1 and nothing I did would
change it. Turns out that the center wire was not hooked to the antenna.
The coax has enough loss that it will only show about 3:1 with nothing
connected to it at 2 meters.

For the meter you have, it is mostly true. I don't know if it is really any more accurate,but it will work just fine. Usually when you get under about 1.8 or 1.5 to 1 that is close enough. The main thing is just to tune for the lowest reflected power. As long as it is low enough the rig puts out full power, that is the main thing in most cases.

Most any of the SWR or directional watt meters will work fine in either direction. You can take the meter you have and hook it up the way you are suspose to and see what you have. The reverse the coax. You also have to keep it in your head the forward/reverse switch will work backwards. That is you set it for reflected power and adjust for full scale. The switch it to forward to read the SWR. That is one way to run a quick check to see if the SWR meter is working like it should. You may see a small differance,but should not be too much.

The meter you have has two coupling wires. One is used to measuer the forward power and one measuers the reflected power. They should be exectally the same. Those 150 ohm resistors should be exectally the same also, but they are ofter eithe r 5 or 10 percent resistors. As with most mass produced items, on line may be a fraction of an inch longer or closer

the the center line. This is not usually a problem. After all , this is not a lab grade instrument. Even the much praised Bird meter is not really that accurate if you read the specifications.

Watt meters are not normally needed to be super accurate. I have a service monitor that origionally cost around $ 50,000. Bought it for under $ 1000 as it was mainly for the old cell phone stuff that is not used any more, but it also works great for other servicing.

The frequecny readout is almost dead on. The specs is something like being within 85 Hz at 850 Mhz. The wattmeter is still only rated for about 5%.

Thanks again for your educational and informative response. I have certainly learned a lot with your help. Thank You!

As luck would have it, today I picked up another one with 2 UHF cables at a thrift store for $5, I couldn't pass it up (the cables alone were worth it) . This one is a Midland 26-126 and it's damaged. One of the 150 ohm R is burned and open, not sure of any other damage. I'm going to replace both resistors and try to get a matched set (close as possible). I have yet to test the meter movement, that's next.

Thanks again Ralph. It is appreciated.

Dear OM's,

Im looking for the SM of the both TRX mentioned in the subject line.
Would be nice if someone of you could drop me a mail with the corresponding
attachment - if possible.

I get both boxes from Ebay in a defect state and would like to get them running.
I know a big effort but it's a kind of hobby for me.

Many thanks in advance for your help.

PS.: The IC245E is receiving in all modes, but don't like to transmit rf.
The IC211E seems to had a defect in the PSU.

218. IC245E/IC211E Service Manual wanted!

Markus -

The Icom IC-245, IC-211, and IC-251 are from the mid to late 1970s.
It is not uncommon for the internal switch-mode power supply to have electrolytic capacitor issues (~ 35 years).

Scott Malcom, KA7MEF at MTS has outlined the most frequent issues with these Icom radios. Scott worked at Icom America service (during this period) so is very familiar with these radio models.

ICOM 211/245(S)/251/451/701
http://www.angelfire.com/biz2/mts/Oldies.html

The most common problem is bad solder connections in the PLL unit and Display driver unit.

BRIEF History: The 211/701 came out in 1976 (give or take a few months), Japan was trying a new type of PCB, with plated thru holes, it didn't work very well so the plated thru holes were replace with pins, these pins were coated to bond with copper and solder, and it almost worked, these pins are breaking down now, and can cause anything from open connections to low resistive connections.
What we are calling updates, are to remove these pins and replace them with copper wire bent over on top and bottom, then resolder the connection. It is important to remove all the old solder. The better method is to add jumper wires on the bottom side of the board (this is what we do, more reliable), I will try to post some pictures of where the wires go, it will take a while though.
The IC-701 only has a few pins, and most of the boards stayed with the platted thru holes.
The IC-211 had 4 generations of PLL's and 3 generations of Display drivers.
The IC-245 uses the same PLL, and had 2 generations of Display drivers.

211 PLL Alignment: The PLL alignment is straight forward, does require a accurate frequency counter and patience. If the frequency is off by more than 4Khz, there are other problems and the alignment sheets won't help.
Most common causes of problems are bad solder joints, dried out caps (electrolytics) and the -9v regulator's (DC/DC converter) associated parts. (it is very rare for the -9v reg. (DP1) to fail!).

PLL Updates This is a picture of updating (wiring) a mid production version PLL (400Kb)211 PLL,

and this is the older version (200Kb)211 PLL Older Version,

and this is the newer version normally called the black board (200Kb) 211 PLL Newer version,
http://www.angelfire.com/biz2/mts/211pllN2.jpg

there is one version newer than this, but it was a version that came out after the production stopped, it was a service upgrade, there are very few of these versions out there and once installed, I am not aware of any problems.
I will try to find a picture of it and post it.
==
IC-251. The 251 is basically a more advanced version of the 211. The Main unit is almost the same. The PLL and Logic are very different. The biggest issue with the 251 is the CMOS logic. It "glitches" and is very static sensitive. The CPU and Expander are no longer available new. Generally it is very reliable, and needs very little maintenance.

Good luck !

Joseph2010-

Ralph is right on the money with his advice. I've had a couple of the
CB-type bridges that worked well on Two Meters.

I think your 1.3:1 measurement may be due to mismatch of the 150 Ohm
resistors in the bridge. But it also could be telling you the truth!
Some dummy loads are not good on Two Meters.

Hooking it up backwards should work the same as forward, except the
switch works backwards.

You normally adjust an antenna for best SWR assuming the meter is
telling the truth. In fact, 1.3:1 is not so bad. If you did not have
that dummy load, you might have adjusted the antenna for a reading of
1:1 and never found out it was not perfect.

One place that is likely to have the manuals, is www.mods.dk. Because
of abuse, they require you to register, and only allow one download per
day unless you donate money.

Other possible sources are www.eserviceinfo.com/browse.php and
ftp.qrz.ru/pub/hamradio/schemes/.

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of

Generally, a transistor designed for VHF will work well on HF, and with (much)
higher gain. When that is ignored, it could be a reason for instability though.

opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with

Hi all,

I've just completed a FOXX-3 radio kit. 40MTR 1W 12V.

I've played with crystal sets, many years ago, when I would try a million set-ups for aerial and earth, but now i would like to be a bit more precise.

I've made an aerial somewhere near the suggested ideas (end feed 1/2 wave), but on switching on. I don't get any signal from the earphone.

What I would like to know is, should any aerial work, just to find out if the radio works, or if the aerial is out of tune, will there be no signal.

Cheers, Camerart.

On 40 meters just about any wire more than 20 feet long outside should bring lots of signals. For receive only, you could just stick a 20 foot or longer wire in the antenna jack and hear something unless you are inside a building that has lots of material that radio waves will not penetrate.

If you have an antenna up that is even within 50% of being intune it should receive lots of signals.

Thanks Ralph,

All I get is a click when I touch a 30ft wire. I've tried moving it
through the circuit and it goes from clicks to a mains hum about 1/2
way.

There is a filter circuit, after the aerial.

Cheers, Camerart.

30ft is near enough to a quarter wavelength on 7 MHz so that should be long enough to pick up signals, especially if you've got an earth connection. An end-fed half wave is a high impedance antenna and your transceiver is low impedance. If you do use an end-fed half wave you need a L-match type antenna coupler to ensure good power transfer.

I'm guessing the mains hum is heard when tapping at the input of the audio amplifier. This proves that the audio chain is working at least.

If not there's a problem with the receiver's detector that in this design is the final amplifier stage. Have you tried a locally generated signal to see if that's heard? If it isn't I'd be checking to see if the xtal osc is functioning.

It should work given the number built, but I haven't had great performance from similar circuits; and the Foxx receiver is very much a compromise. Something with a few more parts will deliver appreciably better performance. Also stages that do only one thing are easier to optimise and troubleshoot than those that try to do lots in a few stages.

I find it interesting that a design that uses 3 transistors for switching and 1 transistor for sidetone can't afford to add 4 diodes and maybe an audio preamp to form a decent receiver with a good balanced mixer. My own bias would be to compromise on the switching but not on the receiver performance. A good but still simple DC receiver is something like http://www.phonestack.com/farhan/dc40.html My version is demonstrated at http://www.youtube.com/watch?v=Tc2ofe7T7Rw

Still, the above is a bit of a rant and if lots of others have got it working fine, yours should work too. When you do it pays to use a resonant 40 metre dipole rather than a random wire (better receivers are less critical due to higher sensitivity & selectivity).

Has anyone else tried these circuits?
I have built 2 examples, a 9 MHZ AGC controlled amplifier and a 20 dB wideband amp for a noise cancelling system.
BIG problems! The diode string in the source of the FET always biases the J310 OFF.
Result, no gain or a loss!!!
It took me an hour or two to twig what was going on. The trouble is that I cannot see how it can possibly work when the gate is referenced to ground. It is equivalent biasing off a valve!
Not only that, but the AGC circuit published at the same time had extreme instability in the front end of the AGC amplifier. I am a VERY experienced electronics person (60 years) and was unable to find any obvious reason for this.
SO Now I have actually began to lose faith in one of my favourite engineers.
Or, have I done something really stupid in my old age.
FYI the circuits were built "dead bug" style with extensive shielding and full decoupling.

Thanks vk3ye,

I've just joined a Ham culb and this is my first radio. I got my licence in 1985, so I must have learned this all before, and forgotten it?? There is also someone at this club who is making one. He will help me as well. I asked this forum, as a way of getting a perhaps different view, also as a crash course for me.

I'm puzzled about one transisor, at the point where I get a mains hum between it and the earphone and I can check there is a connection from the aerial conector and this transistor. I tried an oscilloscope on the transistor, there is a crystal frequency at the Base, but not much on the pin that goes on towards the earphone. I don't know what to expect. but I feel suspicious.

Thanks, Camerart.

FOXX-3 update,

Last night, I remembered there is an offset side tone control, that I
hadn't touched yet. I tried turning it, and this seemed to start it up.
I could hear faint morse code. This morning I'm going to try to tune
the aerial, and see if I can get clearer signals.

Cheers, Camerart..

FOXX -3 further update.

Yesterday I changed the 10yrd wire to the recommended 20.1 MTR wire.
Before there was the faintest morse signal, now I'm back to nothing.

One question, I notice that aerials have insulators on them, I have
wrapped the other end o0f the aerial round a nail on my bottom fence, is
this ok.

Today I'm going to change the toroid windings, and experiment a bit.

Any tips welcome

Cheers, Camerart.

The spread in FETs is rather high so you might have had the bad luck that the ones you used have a cut-off Vgs lower than ~ 1.8V. One issue is strange though: maximum gain occurs not at the limit of V(AGC) of 4V but at a higher voltage. At 8V at the base, one stage (J310 +2N3409) provides for some 16 dB (voltage gain) then but about 10 dB of it is due to transformation from 50 to 2200 ohm at the input LC.

It could be useful to try the circuit with a FET with much higher cut-off gate voltage. An example is BF246C and BF247C. It should work with the diodes in series with the source resistor.

I wonder why you didn't try to get an oldie like the Plessey SL312. Look it up, and see that it's perfect for the job - it provides some 30 dB gain without an input up-transformation and with a larger AGC range.

We need less than a gallon of transformer oil for coolant.
Does anyone sell such small quantities?

transformer oil can be toxic and is difficult to find

We don't want cooking oil.

If transformer oil is toxic, the MSDS would say so.

The question is - what do you want to do with it?

The old MFJ - Heathkit - Cantenna - all you needed was cooking oil.

If you want to hone an engine block - there is alternate substitutes.

If you did an internet search - you would have found what you were
looking for

Amsoil has a lot of variants to their basic supply of oils.

Siemens pays to get rid of hundreds of gallons a month of transformer
oil from their old transformers.

I'm sure ABB and Arriva does the same thing with their service crews.

The thing of it is - although the MSDS doesn't say or does say which is
bad for you. It does not take into consideration what you plan to use
it for.

Just dumping some oil inside of a transformer isn't going to hurt you.

Breathing in the vapors of transformer oil which is being aeroated by a
engine hone can hurt you and can make you sick.
Especially if there is PCB's involved.

Not cooking oil; vegetable or animal derived oils will go rancid over
time and don't handle really high temperatures very well. Mineral oil is
much more appropriate.

> transformer oil can be toxic and is difficult to find

Traditional transformer oil contained PCBs. The new stuff doesn't.

MFJ sells 1 gallon bottles for $30.

There's been no PCB's in transformer oil (or anything else
sold...) since 1979. GE is still trying to clean up the Hudson
River.

Thank you. This is the coolant for the motor controller
we built; for an electric Miata we've named QAR. The heat
sinks have copper tubing embedded in them. We need thermal
conductivity and electrical isolation since the heat sinks are
200V apart, and are not referenced to the frame.

We tried mineral oil but the viscosity is way too high.
Fluorinert would be ideal but would likely cost more than all we
have spent to date. We're looking at DOT5 brake fluid as well.

I'm old enough that products introduced in 1979 still count as "new

Another option is to check your local animal-feed store.

Light, food-grade mineral oil is sold as a laxative for horses and
cattle.

One online source I just checked, lists it at $22 for a two-gallon tub.

If you've got a feed store near you, it might be a significantly less
expensive source for this sort of oil - cheaper than MFJ per gallon
and you could save the (considerable) shipping cost.

Only some xfmr oil is mineral-based. I'm not sure what kind of
transformer oil MFJ is selling, and have a query in with them.

Maybe I didn't read it correctly - I thought he said he wanted something
that was cheap!

Cooking oil - $10.99 a gallon

Some type of industrial oil - Tractor supply? $20.00 a gallon tops!

Your MFJ oil $30.00 a gallon

$30.00 doesn't fit my description of being cheap!

We would first need to know what he wanted to use it for.

Do digital receivers get discussed here much? I am working on a receiver for the WWVB signal at 60 kHz and am looking at a very low power all digital design in an FPGA. Of course some aspects are still analog such as the antenna. I have been reading about loop antennas for low frequency work. I don't plan on having an analog amplifier unless it is needed. I may be able to sample the RF signal directly and use processing to boost the signal out of the noise.

Has anyone done anything like this? Right now I am looking at how to synchronize the sample rate with the carrier so that I can accumulate the signal in a coherent manner.

Any pointers on where I could find more info?

Search for "SDR". Software defined radio. It is hot these days.

You will need the mathematical background to understand and create
designs like this. Of course there are many articles explaining
the digital signal processing, and how to build a program that does
what you want.

At 60 kHz it should be easy. People do this at 30 MHz.

There it is! I had to restart my newsreader to see this message.

Yes, the term SDR is very broad. I was thinking there might be some
folks here doing work in this area.

Yes, the math is rather intense. While the math is always essential,
there are often times when a good seat of the pants feel for the job is
important too. DSP is just the digital version of analog signal
processing. It is the "signal processing" part that is important.

True. I thought I should just mention that because many people are
able to construct such a receiver using analog techniques and discrete
parts, using standard "building blocks" they are familiar with like
an LC bandfilter, an amplifier, an AM detector etc, but would find
themselves in unknown charters when they would have to write down the
mathematical equivalent of what they constructed in hardware.
When you can do that, and are familiar with the usual conversions between
time domain and frequency domain, it should be possible to write the

code (and/or construct it from existing modules).

I have been able to write some DSP code that way, even on a dedicated DSP in asm (which has the extra complication that you need to learn the instruction set, that looks quite different from a normal CPU), and it was fun.

However, before that DSP experiment I sometimes wrote code that looked for zerocrossings and timed the duration between them, and tries to decode data from that, and that is the wrong approach when you want good performance.

DSP doesn't have to be code. In this case it will be hardware in an FPGA. So the calculations will all be done in dedicated hardware. I don't plan on doing multiplies, but that might happen. These chips don't have dedicated multiplier. I've done multiplier designs with the shift and add algorithm, not so hard.

Actually I did a commercial design that way for demodulating a time code signal. It only needed to measure amplitude to get the data, but had to sync to the carrier for "precise" timing. Looking for the zero crossings was a very effective method with an 8 kHz sample rate on a 1 kHz carrier that had a very high SNR.

Yikes! Here you over here too!
Loop antennas sure have more "capture area" than ferrite loopsticks,
using "seat of the pants" engineering, I always wondered just how the
marked directivity of the loop antenna could be put to use in a "dual
Diversity"
scheme for noise cancelling. It was used (and perhaps still is) for
"selective
fading" and interference rejection on large, HF antenna farms.
Marine and aircraft beacon band receivers used both rotatable loops
and loopsticks in conjunction with a "sense" antenna for enhanced
directional reception.
I'm over my head, so I'm bailing. Please keep us informed of progress!

It seems to be the null that is highly directional. I expect when they used loops for DF they turned the antenna until the signal faded and used the null as the directional part.

I ordered some RG-6 with a solid copper center conductor. The shield is aluminum so I'm hoping that doesn't hurt. A number of sources talk about the importance of keeping the conductor resistance low to maximize the Q of the tuning. I need to do my calculations and select the loop size and number of turns. I don't think I want to make it very large, so I'm hoping more turns will compensate for a modest size.

I'll let you know. This group is a little quiet, but that's better than all the noise in some other groups. As I'm sure you know, what is important is not the signal level, but the SNR!

I've been doing more work on the low frequency tuned loop antenna and have two problems. One is that I can't find any info on how effective the antenna will be in relation to the design parameters. That would be the diameter of the loop, the number of turns and the spacing of the turns. From the formulas I find for inductance, I would guess that the spacing of the turns will want to be as small as possible, but I'm not sure the factors that optimize self inductance are the same as what will optimize antenna effectiveness.

What equations determine the signal strength from a low frequency tuned loop antenna?

The other problem is finding an accurate formula for the inductance of this design. I've found a number of equations for coil inductance, but most are for coils with length longer than diameter. One I found doesn't say what it's limitations are and doesn't agree with the others. In fact, I can't find two formulas that approximate each other over the range of interest which is 1 to 20 turns or d/l from 4 on up.

I've consulted the Radiotron Designer's Guide, Nagaoka's and Lundin's papers on inductance of coils as well as a number of web pages. I'm getting tired of looking... Is there a reasonable formula for calculating the inductance of a short coil that works for a number of turns from 1 to 20?

Just to give an update...

I got a response from Randy Yates in the comp.dsp group who gave me a formula for the loop antenna signal strength which I'm including below for reference. He said it came from the ARRL Handbook.

This is the expression for an untuned antenna. Shortly after this, they provide the equation for a tuned antenna, which is identical except for the addition of a Q in the numerator.
-- Randy Yates Digital Signal Labs http://www.digitalsignallabs.com

I did the calculations and at 100 uV/m with 50 foot of coax in a two turn loop I get a bit over 1 uV, not so good. I'm going to see what I can find about the signal level from ferrite cores. I had the impression they would be lower, but I seem to recall better numbers than this in the ones I've seen before.

When I was working with loop antennas, it became rather obvious that optimal receiving loops too are 1 turn, with material of the largest practical circumference. That one turn loop was coupled to one turn as the primary of a coil / tuned transformer and on VLF / LF that concerned a potcore of the proper material. The amount of turns for the secondary could be as much as 100 and with a Q factor of 100 or more that meant at least 10,000 times the voltage of the one turn loop - more than enough.

I have come to a similar conclusion, but not about using a single loop. The single loop is the best antenna if your constraint is the total length of cable. But if your limitation is the size of the loop, it will be improved by more turns at the same diameter.

When I wrote the message you replied to I had left the Q factor out of the equation. I calculated the Q factor at slightly over 100 considering just the resistance of the center conductor. I am also aware of the idea of coupling using a ferrite core. I don't know anything about ferrite cores (I suppose I'll need to learn that soon) and I don't know what the optimal turns ratio would be. I assume that the resistance of the load reflects back into the antenna as a parallel resistance? Using your numbers that would mean a 1 Mohm input impedance would result in a 10 kohm load. At the frequency of 60 kHz and with an antenna inductance of about 90 uH that gives a reactance of 34 ohms. So 10 kohms shouldn't be a problem. But I read one reference that indicated the Q needs to be factored in as well which means it would be 100 ohms vs. 33 ohms, and so 1 Mohm might not be high enough.

The input impedance of the device I am using is not characterized. I'll have to measure it, but I expect it will be rather high, easily 10 Mohm which should be good enough (30x).

I'm also not sure if there will be a loss of Q due to capacitance of the cable. I haven't found a clear reference on this. Some say inter-winding capacitance will reduce the Q, but I don't think this will be subject to inter-winding capacitance because of the shield. So the question is will the distributed capacitance to ground create any sort of problem? This cable has 16.2 pF per foot and I plan to use 50 feet. I expect this will simply appear as part of the resonating capacitance.

I used Al strip, bent in a circle, for the loop (used from 0.1 to 30 MHz). It
was cheap and easy but making a multi-turn loop would have been quite a task.

The antique booklet I have on potcores (Soft Ferrites, October 1973) lists the Q realized with a core of certain dimensions as a function of ue of the material. At 60 KHz, a P 11/7 core with material FXC 3B7/3H1 and ue=68 has the lowest Q, 220. The use of material with ue=220 delivers a Q of 420. This might serve as an estimate of what could be expected: the 11/7 is the smallest potcore and the bigger ones result in higher maximum Q, to well over 1,000.

When using a FET device as input, at 60 KHz the input impedance can be neglected.

The impedance of a source-follower will be much higher than 10 M - at 60 KHz.

With a one turn loop coupled to the one turn primary of an RF transformer, there's no need for a shield. It's fairly easy to provide the piece of wire used for the primary with a center tap that will be grounded so the loop is symmetrical. That also obviates the need for a differential amplifier. A 50 feet loop is huge. I once (in Europe) designed a frequency standard synchronized to DCF77 and reception was OK at distances over 2,000 Km with just a ferrite rod of 12 cm length and 1 cm diameter. In order to keep it easy for constructors, the coil had just 140 turns with 2n2 to resonate the LC. I don't think the approach for WWVB at 60 KHz could be much different (apart from the modulation format). I had designed the ferrite antenna amp as a small device that could be fed via coax, so one could install it in a place with the lowest noise.

Some of the issue may be habit. Over the decades, various WWVB receivers were described, and I remember them all as using some sort of larger loop. It may have nothing to do with design so much as habit, once an idea is planted, others continue it.

In the early days of "amateur radio", everything was so low in frequency, big loops and 60KHz probably weren't that foreign. So the collective memory may retain that, a long time after hams were relegated to those "uselss" shortwave frequencies.

The fact that all those WWVB clocks have relatively small loops is an indicator that not much is needed. I don't know how complicated the receivers have become, if at all. I can get WWVB here in Montreal on my Casio Waveceptor watch, and whatever that uses has to be way smaller than the loops in the small WWVB clocks.

The better the loop, of course, the more selectivity it provides. I don't have any of those WWVB receiver articles handy, but again I remember them as being relatively simple amplifiers, fairly depending on the loop for selectivity. The larger the loop, the more directional it can be, which presumably helps with all the local junk generated that can cause issues.

The analog part (or what most people were interested in until recent times), wsa the antenna and selectivity and a good amplifier. Simple and complicated at the same time. And it's a spectrum area often "unkonwn", not many receivers to tune down there, so one wonders if the signal is there, or it's the equipment, until the equipment becomes right enough for the signal to appear. if I'm building a WWV receiver, it's easy to check for the signal since I have a few receivers that cover the frequency range.

It's not a new field. There was one guy, I can't remember his name, who wrote a number of articles in QST about WWVB and WWVL reception, and high stability frequency standards, I can picture on in the summer of 1971.

Don Lancaster did an article about WWVB, more an introduction, and he has it on his webpage at www.tinaja.com, titled something like "Experiments in WWVB Reception".

Ken Cornell spent a lot of time writing about low frequency work, he had a "cookbook" out at one point, initially self-published but a later edition published by Ham Radio Magazine. But he died, and access to the book other than used died with him.

Ralph Burhan, who was a ham, wrote a lot about low frequencies. Using Loran as a frequency standard (or was it time?), all kinds of articles in various hobby magazines about low frequency antennas (sometimes loops, but often short whips, directly coupled to a very high impedance buffer). I'm not sure any of that is online, but it might be worth a search.

There have been quite a few WWVB receiver articles in the ham magazines, though I have no dates. I think one wsa in September 1971 "73". The ones I saw all predate WWVB's more recent visibility as a feed to all those "atomic clocks". Most were interested in the station as a frequency standard, though as early as that seventies Don Lancaster article, people were thinking about decoders to get the time.

I think there are groups and pages devoted to this sort of thing, but I don't follow it so anyone's search is as good as mine would be.

The interest may be picking up, talk of a low frequency ham band (or is it already in place? I forget). And of coruse, there is the 160-190KHz "license free band" that some have put a lot of effort into, "lowfers", searching for that sort of thing might turn up useful information, albeit needind scaling down to 60KHz.

I remember years ago someone suggested the following to make a 'simple'
multi-turn loop:

Get a length of 'flat computer cable' -- e.g., like the IDE cables for
PC HD's. Such cable can be found in 'surplus' outlets -- sometimes as
an 'end piece' on a cable reel.

Form your loop -- cutting the flat cable to the length you desire.
Connect every-other cable wire to every-other-other (HI!HI!) cable wire.
Your ends, then, are the two outside wires on either side of the
cross-over connection zone.

Such cable can be re-'sized' to just the loop count you want by
un-zipping unwanted runs of the cable.

Depending on how neatly you mount your loop, you should have no problems
with wires shifting position with relation to one another and de-tuning
the resultant lash-up.

I am making a shielded loop so I'm using coax to make the construction
simple. Multiturn won't be a problem.

I'm not sure I understand. This sounds more like a ferrite core antenna
where the ferrite is an integral part of the antenna itself. I was
asking about the type of ferrite for a ferrite loop to use as the core
of a transformer to couple the output using multiple turns to boost the
voltage.

This will be driving an input on an IC so I don't have much info on it.
I expect it is very high impedance just like the FET.

The loop won't be 50 foot in diameter, it is 50 feet of coax wound in some 8 turns give or take. At 8 turns that is 2 foot diameter or 300 mm radius.

As to the shield, I'm told the shield will be a big help in eliminating local interference from E-field sources. I read that household appliances are a major source of electrical noise and I know from experience that my radio controlled clocks seem to have trouble working near my computers.

Yes, if I can get away with it, I'll use a ferrite rod. But I want to eliminate the front end amp and will be driving the input directly from the antenna. The inductance of this coil will be much lower than a ferrite core and will need a lot more capacitance to resonate. The coax coil is what I'm starting with and can always back off to a ferrite antenna if needed.

Thanks for the input.

It could be a habit indeed because calculation would show that unless outside the intended range, a fairly small loop is required. Another topic where habit shows well regards PLL: even for AM reception, design resembles that for FM reception (limiter).

Low in frequency and power, big loops might be useful. Here in Panama with many months of thunderstorm activity, a broadband loop with S/N comparable to a long wire but without the QRN would be rather useful. It's a work in progress but if it would be easy, it would already exist.

With DCF77 it's the same. Good enough reception with a ferrite antenna as used in small MW portables. After a source-follower eventually an amp with more selectivity, when (back then) interference from TV sets would be a problem (harmonics of line output transformer).

When the major issue was a reference frequency, I used a 10 MHz VCXO, and with the proper dividers that resulted in a mixer as the first or second stage, with an IF so low that simple RC audio filters could be used. The selectivity was phenomenal.

Several of my receivers can be tuned down to a few KHz as well, and on the 85 meter long wire, despite complete mismatch to 50 ohm, WWVB can be received though not more than ~10 dB above noise - on a rare day without thunderstorm. Panama is clearly outside the intended service area.

Nice site, the article including a WWVB receiver leaves no questions.
The web has quite a few photos of WWVB receivers, also indicating how simple the loop can be. One: http://www.nixiemagic.com/

I started reading Ham Radio in 1975 so probably missed that. The importance of LF is without doubt, just count the number of (military) FSK transmitters below ~400 KHz. With an online SDR in the Netherlands they can even be heard below 10 KHz.

The use as frequency standard was very popular in Europe too, hence I had to
design one for DCF77 (77.5 KHz) and later for DLF, a LW transmitter at 153 KHz.
The output had to be a synchronized 10 MHz clock and an error indicator, when
the signal was temporarily interrupted.

>

Since the timing info also was sent as phase modulation, I lost interest.
Although the average frequency remains the same, the modulation is transferred
to the VCXO which makes short time measurements inaccurate. In Europe, LW
transmitters were phase modulated with program info to facilitate automatic
receiver tuning so DLF no longer was useful either.

In Panama, ham radio regulation follows that of the US, with exception of CB
which is prohibited. The new ham band (136 KHz) might be a good idea here too,
plenty of room for a balloon antenna like the one described here:

Hi Michael,

I certainly don't have a habit in this area. I am a total newbie in
antenna and even radio design. What I know somewhat is DSP and my goal
is to design a 100% digital RCC (Radio Controlled Clock). I am also
trying to make it as low power as possible so that it can be powered
from scavenged energy sources... no batteries, no wall plug. Just set
it on the wall and it runs.

Yes, they aren't terribly high power either. As I've said elsewhere, I
am starting with a loop antenna because it can give me the largest
output voltage without an amp and I can save that amount of power. If
it turns out that I can find an amp that will provide adequate gain and
not use much power I can go that route. For now I want to try the large
loop antenna.

I've seen a number of these designs, none are optimized for low power
using load resistance in the 10 kohm or lower range.

Yes, I have this article.

I've found tons of self-construction web pages on loop antennas, but no
so many cover the theory a lot. I've found a small number that are
better than most and have useful info. It was Randy Yates in the
comp.dsp forum who gave me the formula for received signal strength from
a loop antenna from the ARRL handbook. That helped tremendously and
allowed me to understand a similar formula I had found for antenna
equivalent height.

One of the antenna pages I read was about using a low frequency band
with "special" permission. He wanted a loop receiving antenna so he
could steer the null to his transmitting antenna. This was 2 turns, 10
foot in diameter, a big one! He is the one that used a ferrite doughnut
to transformer couple the output with 10 turns IIRC.

I found the schematic of icom's HM-7 hand powered mic.
One of the resistors inside is 18KOhm or 1.8KOhm ???

Kosmas-

I found that same schematic on the web. I did not take my microphone apart to verify, but assume the resistor is 1800 Ohms (1.8 KOhm). If you look closely, you can see a speck where the dot should be.

That resistor, along with the 10K Ohm resistor, determines Voltage at the transistor base, which is about 0.65 Volts higher than at the emitter, which sets the transistor current.

Suppose the collector Voltage is about 5 Volts. Base voltage would be 5 times 1.8/(1.8+10), or 0.76 Volts. Emitter voltage would be about 0.1 Volts, so current would be about 0.1/22 or 4.5 ma if I did the math correctly. If the resistor were 18 KOhms instead, current would be unreasonably high.

You can get a better idea if you look at the circuit of the rig the microphone goes to. I'm fairly sure the HM-7 was used with an IC-22U, which is where my microphone came from. (Mine is not marked as HM-7.)

My error - the IC mentioned should be SL612C and nowadays it's available from
China via eBay:
http://www.ebay.com/itm/120922014405?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1497.l2649
It has a much wider AGC range than the TL026, up to 70 dB IOW higher than the
stage gain.

If it's an electret microphone element, you could check out the datasheet
and see what it recommended. (The kind with the built in FET, and about
the only kind that Japanese have seemed to have used for decades).
I have a vague memory of the Panasonic listing in the Digikey catalog with
recommended resistors in the 2k to 5k range.

Kosmas-

I dug out my old Icom microphone and found it was the one for an IC-22S,
which does not have an amplifier. So far, I have not found a copy of
the IC-22U diagram, so do not know what the amplifier load resistor is.
It appears the HM-7 would work with newer radios such as the IC-718,
which has a DC load resistance of about 1200 Ohms (1K AC + 220 DC).

I assumed that the radio has a regulated voltage to feed the microphone
amplifier, probably 8 Volts like the IC-718. The Base-Emitter junction
of the transistor might be around 0.6 volts for silicon.

If the unknown resistor is 1800 Ohms, current in the transistor would be
relatively low, and collector voltage would probably be a little higher
than 4 Volts depending on the load resistor.

If the unknown resistor is 18,000 Ohms, current in the transistor would
be higher, and collector voltage would probably be lower than 4 Volts.

For this value, the circuit might work as well without it!

Perhaps it would work with either value resistor, but I prefer the 1800 Ohm choice. I wish someone would come along with an HM-7 who can open it up and check resistors.

Mark-

The Icom HM-7 is at least 30 years old. It has a 600 Ohm dynamic element with a 2SD661 silicon transistor amplifier. The HM-7 design is similar to a transistorized carbon microphone replacement. The resistor equivalent to the one you refer to, is inside the radio.

This discussion is about a bias resistor. Picture a 10K Ohm resistor connected between the transistor collector and base, with another resistor connected from base to ground. This second resistor is either 1800 Ohms or 18,000 Ohms. (Actually the microphone element is connected between the resistor junction and transistor base.)

I found the diagram in an Icom IC-22U owners manual, but it is hard to see if the value is 1.8K or 18K. There is a tiny fly-speck where a decimal point could be.

I think the only way we will know for sure, is if someone has an HM-7 and will open it up to see.

Hello Kosmas, I looked inside my HM7 mic. which
came with my Icom 740, the resistor is one point eight K.
(1.8k), and is in parallel with the 4.7uf. capacitor as shown
in the schematic. I checked the value of this resistor with
digital meter,and it confirmed this resistance value.

Let's see. SL612, $8+ each. TL026 $1.50 each.
-3dB bandwidth - SL612 up to maybe 15MHz. TL026 up to 50MHz.
SL612 AGC range 70dB, gain of 34dB. TL026 AGC range 50dB, gain of 38dB.
SL612 obsolete. TL026 in production.

An AGC range far in excess of stage gain isn't much use if the stage
is overloading anyway.

Why again would I consider the SL612? :-)

In order to connect a 2m/70cm radio and a 1.25m radio to a triband antenna (2m/1.25m/70cm), one requires a triplexer and diplexer. I'd like to cut down on the number and size of equipment to do this.

I asked Comet about making a single compact unit that takes 2m/70cm on one port and 1.25m on the other. Mick Stwertnik told me that they designed and specced it out, but the cost would be a prohibitive $200-ish.

So I investigated making my own and found Jim Tonne's Diplexer program. I asked him if he could extend the program to allow for designing triplexers. He had some hackish solution that sort of worked, but he doesn't know the math to do it correctly in the first place.

Where should I go from here?

I found a schematic at an japanese site too.
The resistor is 1.8Kohm.
I finish it and it is working loud and clear.
I have an icom ic-738 transceiver. I have both
hm-36 and sm-20 microphones. The hm-326 has very
low output and can't drive the transceiver to full
output on ssb. The sm-20 has enough power but it
picks up any surround noise (blowers, my children,
telephon rings, TV etc etc). So i need a
dynamic microphone with enough power to drive well
my transceiver without too much sensitivity.
I have an old dynamic handy microphone from a CB
transceiver and I put inside a preamplifier on a
small pcboard and it works fine.

Thanks to all for your help.

David-

I take it your 2m/70cm radio has a single input with an internal
diplexer. I use a Comet CFX-324 triplexer, but my Kenwood TM-742 has
three separate inputs.

It seems to me that your radio's input might satisfy the need for a
2m/70cm diplexer. What would happen if you connected your triplexer's
2m and 70cm ports together with a co-ax T?

You might check SWR looking into the T, to see if it was close to 1 to 1
on both bands with the antenna and 1.25m ports terminated.

Rather than using the triplexer/diplexer combination, there might be
less loss if you use a separate antenna for 1.25m, with just a diplexer
for 2m/70cm.

The data sheet of the TL026 doesn't mention the maximum input signal that can be processed. For the SL612 that is 250 mV rms. Then there's the supply current: less than 5 mA for the SL612 but for the TL026 it's 6 times as much. Not to mention the issue of stability.

For an IF higher than 10 MHz, the SL611 has -3 dB at 80 MHz and for the SL610 that is 120 MHz. On SW, an IF amp with low NF allows for a passive mixer as long as the overall NF stays below ~10 dB. The SL612 has a 3 dB NF and a passive mixer like the VAY1 a loss of ~ 5.5 dB so even with some input filter losses, one can design a radio with high dynamic range, low power consumption and NF <10dB. Who would need a TL026? :-D

With so many data sheet archives online, I could have hit the wrong one. But what didn't fail to get my attention was the remark "Other Characteristics Similar to NE592 and uA733". With those ICs I'm not only familiar but they are from the era when customarily, the equivalent internal diagram was published so uninitiated application engineers could use the IC in a fashion, not intended by the designer. The NE592 and uA733 employ negative feedback which is at odds with voltage controlled gain - unless the gain control is before the stage(s) with feedback, and then the S/N under application of feedback deteriorates.
So the TL026 isn't my choice even if it's modern ;-)

I was not thinking. With a separate 1.25m antenna, no duplexer would be
needed with your radio for the 2m/70cm antenna! That might be the
simplest arrangement.

Since the TL026 is a currently-produced part by TI, there's no need to
sift through online archives. Just go to http://www.ti.com/ and look
up the part number.

Fair enough. Of course, the TL026 *isn't* either of those parts,
and the statement suggests to me that the TL026 has input and output
characteristics similar to those non-AGC parts - relatively easy to use.
Nothing at all about internal architecture. Perhaps you're reading
something that isn't in the datasheet at all. Given how cheap the TL026
is, perhaps you might try one instead of an SL612 and see if your
assumption is true.

But, seriously, you're quite passionate about the SL612 and
that's a wonderful thing.

What remains is the large current consumption - typ. 22 mA.
For the SL612 the typ. value is 3.5 mA.

Cost is a nonissue as is production. Another 30 mA just for the IF amplifier of
a noise blanker is an issue though.

No, for the noise blanker it's the best solution. The IF minus impulse noise
will be processed by another no longer available IC, the TCA440. Its mixer and
IF combined have an AGC range of ~100 dB with max input to the mixer, 500 mV
rms, current consumption ~11mA. With the 30 dB AGC range of the 2nd mixer, > 120
dB AGC range. That mixer will convert to 25 KHz, a nice value for razor-sharp
notch filters and ideally working (synchronous) demodulators. Why be satisfied
with less when it's so easy to design a radio that functions well with input
signals between 0.1 uV and 100 mV and yet has a low power consumption? ;-)

Viet Nam still uses PCB's I can get them there.

According to the spec sheet curves:
The j310 gets turned off with a bias of 3.7vdc,

Quiescent of 3ma that is called for gets set at 3.3vdc bias.

Meaning the resistor in series with the diodes is going to drop .54vdc at 3ma.

so it is going to fly on the Vdrop of the diodes Vdrop that changes with temp also? Might work in a spice sim but not in real life.

Yeah this is a cascode amplifier, great for eliminating miller effect, and gain that is the gain of the bipolar times the gain of the fet. Another reason they swamp the gate with 2200 ohms with all that gain. well except in your case.

Lastly Since they are using diode drops for bias I would have used a TL431 precision and temp compensated regulator, would be alot easier to set that 3ma quiescent current.

"Understanding Digital Signal Processing" by Richard G. Lyons is a good
source of information.

If you plan to do the FPGA code yourself check out: www.myhdl.org

For the antenna consider: www.febo.com/time-freq/wwvb/antenna

At 60 KHz RG-58 would be as good as RG-6 for a loop antenna and much easier to work with. PCV pipe is a good material for the frame. email me directly and I'll send you a photo of a 1m VLF antenna I made.

Unless you are located in Boulder, CO you will probably need an analog amplifier.

Hi Gary,

Thanks for the info. I am familiar with Richard's book. He seems like a good guy and will provide errata for anyone who has bought his book. I am familiar with DSP in general and digital receivers specifically. I have most of that part of the design analyzed enough to begin coding. It is the ADC that I have had some trouble analyzing. I have been planning to construct a Sigma-Delta converter in the FPGA. Turns out this might be a little power hungry and I won't be able to use the special dithering that shapes the noise. My primary goal is to do this entire project with very, very little power consumption. If I can get a strong enough signal I can just use an LVDS input without the integration of a Sigma-Delta converter, but I won't know until I get some of this built and tested.

I am very experienced with HDL so I should be ok there.

I have found any number of sites that talk about loop antenna construction, but most don't really explain how to analyze them. I have finally cobbled together a good picture of the technical aspects from a number of web sites and have an antenna plan. I am looking at using 50 feet of RG-6 with copper inner conductor to optimize the Q. My initial pass is a compromise between optimizing the signal strength and making the final unit easy to construct and support. It will be 8 turns on 2 foot diameter wooden spokes. I expect the stiffness of the RG-6 to help support the cable. This would likely be a decent design up to four foot diameter.

In the end I may find I can use a ferrite loop. But the signal strengths I have seen from commercial ferrite antennas do not seem to be

good enough, around 8 uV for 100uV/m field strength which is about what I expect to see here on the east coast.

As to the amp, we will see. I have an equation to predict signal strength at the antenna output and I am expecting a decent signal level if I have a good Q and transformer couple the output. Total gain (Q and transformer) over an untuned antenna will approach 10,000.

But there is many a slip between cup and lip. I hope to make some progress on this over the holidays and have some test results.

Can you explain why you think RG-58 will be as good as the RG-6? The inner conductor of RG-6 has only a small impact from skin effect, I think it is around 21%. At 32 mil the inner conductor of RG-58 (compared to 40 mil for RG-6) will have even less impact from skin effect, but will have a higher resistance and so a lower Q. The capacitance per foot is nearly twice that of RG-6 as well although I'm still not clear on the specific details of this effect. I believe higher capacitance will lower the self resonant frequency although I don't expect this to be a problem in my application.

I don't understand how you intend to use an LVDS input for the WWVB signal?
Could you explain.

Have you considered using a WWVB receiver IC? I don't know what kind of
power they require but they generate the 1pps PWM signal which could be
processed by a low-power microprocessor very easily.

http://www.c-max-time.com/products/showProduct.php?id=2
http://www.pvelectronics.co.uk/index.php?main_page=product_info&products_id=7
http://www.ntp-time-server.com/wwvb-receiver/wwvb-receiver.htm

I've constructed loop antennas using both RG-58 (60 KHz) and RG-6, or
something similar to RG-6 (~20 KHz) and had good luck with both. I haven't
compared the outputs of both tuned to 60 KHz so I can't say much about how
their electrical performance compare. The RG-6 with the aluminum shield is a
PITA
because you can't make a solder connection to it. Self-resonance will not be
a problem. 100' of RG-58 on a 1 meter dia. frame required about 25 nF to
resonate at 60 KHz. One advantage of the febo-type antenna with the 1-turn
pickup loop is that its output impedance is very low which means that the
antenna can be located away from the receiver.

I guess you didn't read my initial post. My intent is to create an all-digital receiver at very low power. The receiver ICs around use standard analog technology to detect the AM signal. WWVB has added phase modulation which should be receivable at a lower SNR. I also want to detect both modulation schemes and compare the results.

They are fairly low power as can be CPU chips when cycled on and off as needed. But I want to do this in an FPGA so I can see just how low power it can be.

The cable I have already has F type connectors on the ends, so I don't care about the aluminum shield. I did have to shop around a bit to find one with an all copper inner conductor. Seems they use copper coated steel for CATV. I think my numbers are for a bit less than 80 nF of capacitance so I bought a bunch of 15 nF silver mica parts and some other small values to tune it in closely, then I have a triple bank, 0-500 pF tuner cap from an old receiver for final tuning. Once I have the rest of the system working well, I'll likely use fixed values of caps to tune the antenna without the variable cap. I saw one antenna that used a bank of roughly power of 2 caps with switches to allow the antenna to be tuned easily, cute.

I am thinking of using a ferrite core as a coupling transformer as it will give me a lot of voltage gain. I am looking to get towards 10,000 gain from combined Q and transformer.

The LVDS input on the FPGA will act as a 1 bit ADC. I was planning to use this in a Sigma-Delta converter and produce a 4 bit value at 240 kHz (4x carrier rate). I'm not sure I need the Sigma-Delta converter and might end up just using the 1 bit from the LVDS directly. By downconverting to DC and downsampling to 30 Hz I will get a *lot* of processing gain with an SNR improvement of some 33 dB (assuming uncorrelated noise). Another way to look at the digital design is as a very long FIR filter resulting in a filter with a very narrow bandpass or one bin of a DFT. Turns out they are all the same math in this case (multiply by 1, 0, -1, 0 sequence).

There are a few wrinkles I haven't figured out yet. I need a sample clock that is both accurate and low power. I have yet to find that. XO oscillators I have found over 1 MHz are all in the mA range. I'm thinking of using the very poor internal oscillator in the FPGA and calibrating it to a 32.768 kHz reference which can be both accurate and low power. But I don't yet know if the internal oscillator is low power enough. I need to fire up the eval board (gratis from NuHorizons) and measure the power consumption with and without the internal oscillator enabled. If the power consumption is low enough I can frequency lock it to the clock oscillator and come up with a calibration factor. Then the sample clock can be generated internally using a DCO updated with each calibration.

Thanks for discussing this with me. I like to bounce ideas off of other people.

I thought I would cross post this to rec.radio.amateur.moderated. They
have made a number of announcements about this and seem to be
encouraging the practice.

In my haste to get the last newsletter out, I forgot one important item.

During the last Nebraska ARRL State Convention, Elmer Squad Leader and Assistant Section Manager Dar Piatt, W9HZC, donated one of his qrp projects to Harold Kramer, WJ1B, Chief Operating Officer of the ARRL. Harold said he would display it at ARRL HQ.

Imagine Dar's surprise and delight when he saw his "ham can" version of a RockMite QRP transciever on the cover of the January 2013 issue of QST! Dar was given full credit in the cover description on page 5.

Congratulations, Dar! That's one small can for a ham and one giant leap for qrp.
